2010

**Enterprise Vulnerability,
Patch and Config Auditing**

**Continuous PCI and FDCC
System and event monitoring**

**Agent and Agentless
Log Aggregation and Search**

**Network monitoring of
Servers, Clients and Databases**

**Continuous Web Application
Security Assessments and Monitoring**

- Database Activity Monitoring
- USB Device usage
- Botnet and Virus detection
- Software Enumeration
- Insider Threat detection
- Antivirus auditing
- 3D network and event graphs
- File integrity monitoring
- 24x7 discovery of systems
- ... and much more !

PART 1 - COMPLIANCE STANDARDS

**Demonstrating
compliance is
just as difficult
as understanding
why**

**Figuring out
ways to enforce
desired state
isn't that easy
either!**

Precision landing FAIL

**When we do get
it right, we don't
want to stray
from the desired
behavior**

An aerial photograph of Washington, D.C., featuring the Washington Monument as the central focus. The monument is a tall, white, obelisk-shaped structure standing on a circular base. Surrounding the monument are green lawns, paths, and a large circular field. In the background, the dense urban landscape of Washington, D.C. is visible, including various government buildings and residential areas. A yellow text box with a black border is overlaid on the right side of the image.

**The USA Federal
government has
outpaced
commercial and
international
standards**

National Vulnerability Database

automating vulnerability management, security measurement, and compliance checking

Vulnerabilities		Checklists	Product Dictionary		Impact Metrics		Data Feeds	Statistics
Home	ISAP/SCAP	SCAP Compatible Tools		SCAP Events	About	Contact	Vendor Comments	

Mission and Overview

NVD is the U.S. government repository of standards based vulnerability management data. This data enables automation of vulnerability management, security measurement, and compliance (e.g. FISMA).

National Checklist Program

Formerly the (NIST Security Configuration Checklist Program)

Federal Desktop Core Configuration settings (FDCC)

NVD contains content (and pointers to tools) for performing configuration checking of systems implementing the FDCC using the Security Content Automation Protocol (SCAP). FDCC Checklists are available here (to be used with SCAP FDCC capable tools). SCAP FDCC Capable Tools are available here.

Resource Status

NVD contains:

26244 CVE Vulnerabilities
114 Checklists
91 US-CERT Alerts
1987 US-CERT Vuln. Notes
2966 OVAL Queries
11941 Vulnerable Products

Last updated: 08/24/07

CVE Publication rate:

17 vulnerabilities / day

Email List

Select the email list(s):

Checklist resources:

- Checklist Program Website
- Checklist Repository
- NIST Special Publication 800-70: Security Configuration Checklists Program for IT Products

The Cyber Security Research and Development Act of 2002 tasks the National Institute of Standards and Technology (NIST) to "develop, and revise as necessary, a checklist setting forth settings and option selections that minimize the security risks associated with each computer hardware or software system that is, or is likely to become widely used within the Federal Government." Such checklists, when combined with well-developed guidance, leveraged with high-quality security expertise, vendor product knowledge, operational experience, and accompanied with tools, can markedly reduce the vulnerability exposure of an organization.

**PCI is still criticized for
not being tough enough
or too difficult**

What is PCI?

Pass Quarterly Vuln Scans

Demonstrate that your patching, AV, firewall, IDS, web apps, wireless, WAF, user access, configs and databases are secure.

PCI IS GOOD – BUT IT POINTS FINGERS

Government	Commercial
Single standard with enforcement	Many standards and no enforcement
Trying to make agency communication work	Trying to make department communication work
Moving towards continuous monitoring	Figuring out that anti virus isn't working

20 Critical Security Controls

Twenty Critical Security Controls for Effective Cyber Defense: Consensus Audit Guidelines

[Click here](#) to view our 20 Critical Controls interactive feature!

The Twenty Critical Security Controls have already begun to transform security in government agencies and other large enterprises by focusing their spending on the key controls that block known attacks and find the ones that get through. These controls allow those responsible for compliance and those responsible for security to agree, for the first time, on what needs to be done to make systems safer. No development in security is having a more profound and far reaching impact.

These Top 20 Controls were agreed upon by a powerful consortium brought together by John Gilligan (previously CIO of the US Department of Energy and the US Air Force) under the auspices of the Center for Strategic and International Studies. Members of the Consortium include NSA, US Cert, DoD JTF-GNO, the Department of Energy Nuclear Laboratories, Department of State, DoD Cyber Crime Center plus the top commercial forensics experts and pen testers that serve the banking and critical infrastructure communities.

The automation of these Top 20 Controls will radically lower the cost of security while improving its effectiveness. The US State Department, under CISO John Streufert, has already demonstrated more than 80% reduction in "measured" security risk through the rigorous automation and measurement of the Top 20 Controls.

The security Templates that have "Analyze" as part of their file name, should never be used to configure a production system. They are meant only for use with the Security Configuration snap-in to the MMC to Analyze the security configuration of the system.

These templates are guaranteed to break a production system if they are used for configuration. In all probability the system will not be recovered, and all software will have to be reinstalled.

How did you test for MS08-067?

Microsoft recently released a critical security bulletin, MS08-067 that described a privately reported vulnerability in the Server service and provided a patch for this vulnerability. What was unusual was that this bulletin was released independently of Microsoft's usual patch notification process and caused quite a bit of concern for many organizations. Tenable used this opportunity to help a number of organizations monitor their networks to determine if this issue had been mitigated. I had the opportunity to speak with many different customers and was surprised at the different priorities, techniques and level of response that varied from organization to organization. In this blog, I will share some of the situations and trends I ran into while working with Tenable [Nessus](#) and [Security Center](#) customers.

Tenable's research team [released two checks](#) for MS08-067. The first check (plugin #34477), works [without any credentials](#). It verifies the ability of connecting to Windows systems on port 445 or port 139 without credentials for it. This plugin has the advantage of being fast and not requiring any credentials. The other check (plugin #34476) performs a more thorough audit for the same vulnerability. This plugin performs file

EXPECT TO BE COMPROMISED

Make them work harder to leverage any compromised target

Reverse shells,
phone
homes,.etc
prevented by
ACL in network

*Exploits work, but we're leveraging that the attacker
does not know our defenses*

Need to have a process to investigate false positives

MAKE THEM JUMP THROUGH HOOPS

Make them work harder to leverage any compromised target

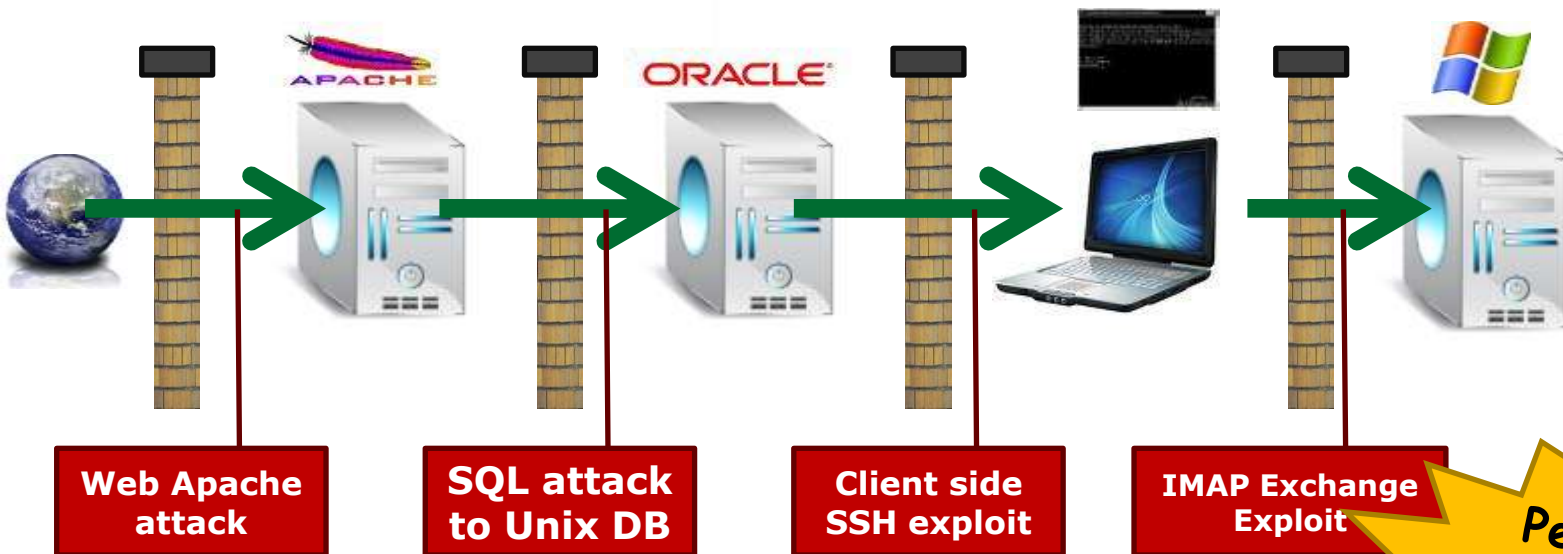

Proxies prevent
some tunneling.
Packet shapers
can slow
access.

*Most IT organizations are OK with proxies and packet shapers
Are they hooked up to your SIM or NBAD and part of your
monitoring?*

MAKE ATTACKERS REQUIRE DIFFERENT EXPLOITS

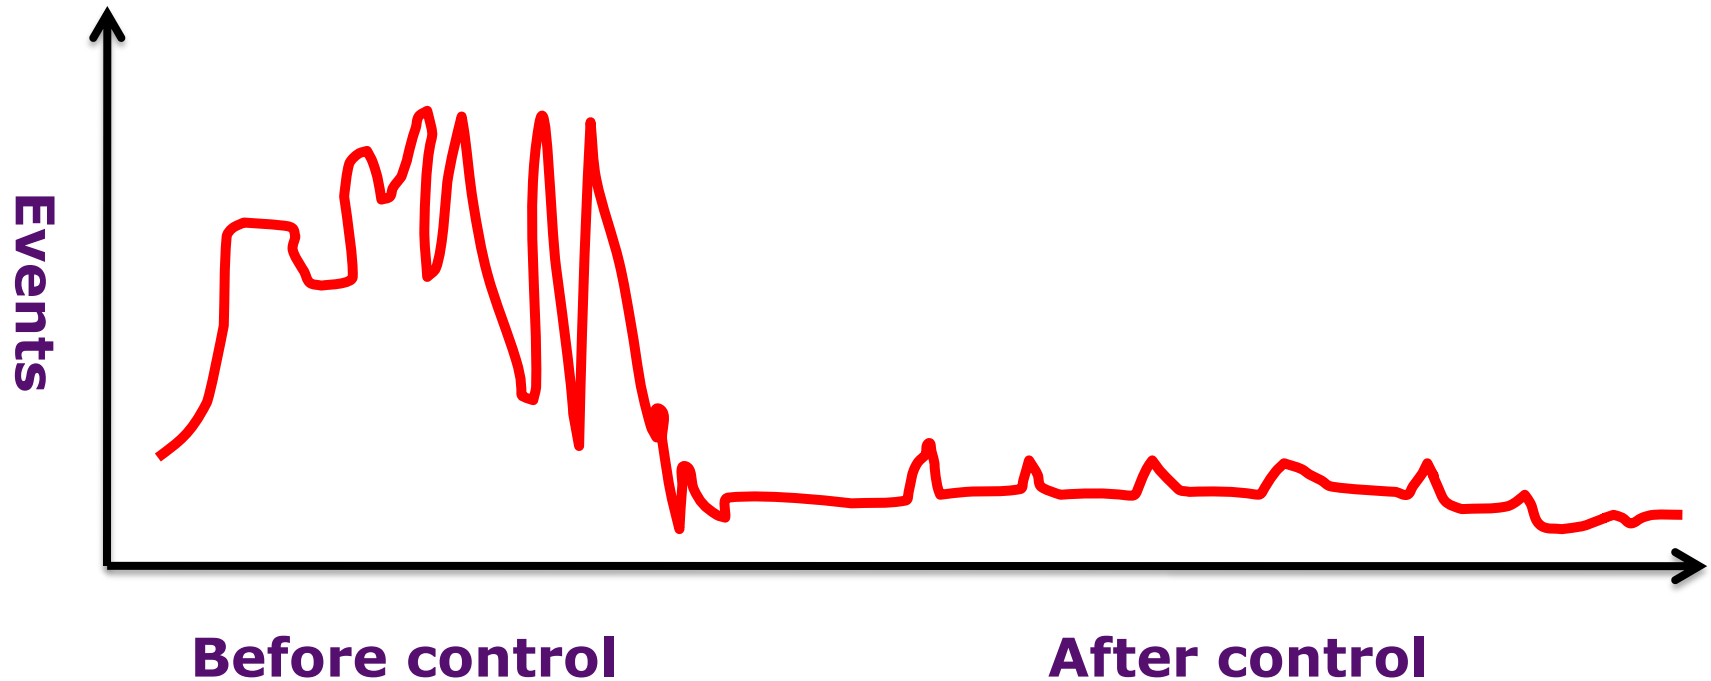

Force them to think – and less likely be a botnet

Pen testers
pride
themselves
on doing this.

*Are you looking for these exploits to begin with?
Does your SIM chain together these types of attacks?*

Impact on Security Posture

- Should simplify NIDS, firewall, SIM and other types of monitoring.

Impact on Security Posture

- **Should make detecting anomalies much easier**

Let's talk about RISK
METRICS in closing

Does
RISK X ASSET VALUE
really help?

**How do
you handle
inheritance?**

**Does risk scoring
help out in *triage*?**
